

# Shot Blast!

*Our new finishing system protects our liftgates from salt, corrosion, and hard impacts for a longer, trouble-free life.*

## Total In-Shop Finishing

*At Anthony, we strive for total quality!*

*Our new finishing process lets us totally clean, prepare, and powder coat all liftgate weldments to give you the best looking, longest lasting finish in the industry.*

**Cleaning** – An abrasive steel shot blast (similar to sand blasting) thoroughly removes any dirt, rust, paint, mill scale, and other contaminants.

**Surface Preparation** – The pummeling steel shot descales and profiles the steel to a "white metal" finish for the finest possible powder adhesion.

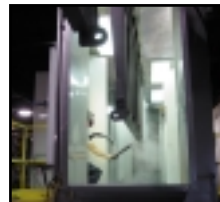

**Powder Coating** – Powder is electrostatically applied to all surfaces; then parts are baked at 350° for a finish that looks great and holds-up in harsh operating environments.

### Advantages:

- Improved coating adhesion
- Improved surface finish
- Better impact resistance
- Increased wear resistance
- Increase fatigue resistance of parts

*Platform surface is shot blasted to a "white metal" finish.*

*All parts go directly into the powder coating booth.*

*Attractive, impact-resistant finish*
